

Meeting Objectives

- ☒ ~~Discuss what the work items we need to complete in order to get both projects to a state where we can start working on features.~~
- ☒ ~~Discuss roughly what the features are that we want.~~

Meeting Objective 1

- Things our project needs to have:
 - Backend
 - ORM (GORM - Go's ORM)
 - An example entity (pg table & DAO)
 - Ability to add an automated test (just configure it at this point)
 - Logger (uber's zap)
 - Migrations
 - Middleware
 - GraphQL
 - Session
 - Permission checking (authorization)
 - Authentication
 - OAuth
 - Google
 - Github
 - Spotify
 - JWT
 - Frontend will pass this token when making POST requests to GQL
 - Add DB container
 - Service function(s) to connect to the Spotify API
 - Environment variables/files
 - Frontend
 - Tanstack npm package install
 - Configure UI project to use tanstack routing
 - Add a default home page using tanstack workflow (tanstack query, routing, etc.)
 - Add Component folder to project
 - Ability to add an automated test (just configure it at this point)
 - Logging

Meeting Objective 2

- What features do we want?
 - Users
 - Friends list (follow people)
 - The user needs the ability to make a list of songs/albums that they've listened to.
 - The user needs the ability to make lists & add songs or albums to these lists. (users can add both songs & albums to a single list - tentative).
 - The user needs the ability to rank songs on an album
 - The user needs the ability to add a review to a particular song or album
 - Or songs within the album too?
 - The user needs the ability to comment on another user's review.
 - A user's profile settings should allow them to configure the theme they want, Light/Dark. Upon selection, the theme the user chose is used throughout the site.
 - The user needs the ability to be able to see their profile, as well as other user's profiles.
 - "Watchlist" A list of things that you want to listen to (songs or albums)
 - Add "Song" or "Album" profile page. Essentially acts as the page you see when you click into a movie on letterboxd. In letterboxd, this page shows the movie poster, cast, description, and other details, this page also has buttons that allows the user to add a movie to their watchlist or review a movie, we'd want the mega equivalent for songs on our app. (does Genius have an api?)
 - Home or landing page when you first login, show all the popular albums, there's a list of the most popular reviews for a given time period, popular list
